From email 2/26/22: "Skiing in the Northern Bridgers today, one skier in our party of three triggered an avalanche in October bowl. The slide was approximately 40 yds wide and ran around 150 yds. The skier was carried approximately 100 yds, but was not buried and sustained no injuries. Neither of the other members of our party were in the slide path when it occurred... photo shows the slide from the bottom and the approximate path the skier was on when he triggered the slide."

Advisory Region
Bridger Range
