Natural avalanche in Great One, Bridger Range

The Great One Bridger Range 2/2/2020 Code HS-N-R3-D3.5-O Elevation 8600 Aspect NE Latitude 45.89260 Longitude -110.96200 Notes

Saw this today while skiing. This crown is on a northeast <u>aspect</u> at about 8600 feet. Crown height 6-8 feet. It is mid path in the Great One. It seems to have naturally avalanched on Sunday during the storm, without a <u>cornice</u> trigger, after the wind event. All I can get here is that the slope was overloaded from storm snow, on top of a recently overgrown hard <u>slab</u>. Looks like it initiated higher up and pulled out much deeper below. Definitely a large <u>hard slab avalanche</u>. HS-N-R3-D3.5. Debris made it to the trees in the historic path. Otherwise, northeast aspects are loaded above 8500 feet, and I saw about 14 inches of new at 8000 feet. No <u>loading</u> during the day today.
