

Divide Peak

Date

Sat, 01/23/2021 - 09:09

Activity

Skiing

Dug a pit on a southwest facing slope at around 9500 feet. Found a top layer of new snow, few inches bonded ok. Main layer on facets 75 cm deep. ECTP26 took quite a bit of force to get it to release from the layer. Facets were harder than a couple weeks ago but still garbage snow on the ground. Numerous recent avalanches spotted in next drainage to the north. See pictures.

Region

Northern Gallatin

Location (from list)

Divide Cirque

Observer Name

Nick English
