Remotely triggered wind slab in N. Bridgers

Northern Bridgers Bridger Range 2/26/2022 Code HS-ASr-R3-D1.5-O Elevation 8000 Aspect NE Latitude 45.93910 Longitude -110.97800 Notes

From obs 2/26/22: "We were stopped on a flat bench on top of a steep rollover... when we heard a whumpf, and then a hard <u>wind slab</u> released on the slope below us and ran into the trees below. We then decided to enter the avalanche at the bottom of the debris to look at the crown, where we observed that the <u>slab</u> was about 60cm deep at its deepest, and ran around 50 feet wide, wrapping across a small <u>aspect</u> change. We did two ECT tests and observed <u>propagation</u> on the layer during isolation in both tests... We identified a P hard <u>wind slab</u> overlaying a 3 cm deep layer of 1F hard facets. The layer below the avalanche interface was F hard facets. After this result, we dialed back our ski plans for the day." Photo: M. Beck
