

This slide is a good example of slopes where avalanches can be triggered. Ones that are steeper than 35 degrees and have a relatively thin snowpack. Other parts of Skyline Ridge have areas of thin snow. Avalanches can be triggered in these zones but they will propagate into deeper areas and make a large avalanche. Photo: GNFAC

Advisory Region  
Southern Madison  
Longitude  
-111.20W

Latitude  
44.90N
